Vector Backbone Description: Backbone Marker:Invitrogen; Backbone Size:2580; Vector Backbone:pENTR-D-TOPO; Vector Types:PCR cloning vector; Bacterial Resistance:Kanamycin

Comments: The DNA sequence was amplified from pooled wild-type TAB zebrafish embryos. According to the predicted sequence, XP_005171293.1, there are likely polymorphisms, K185E, H323Y, S599N, which are not listed in the current ENSEMBL database. This is possibly due to incomplete zebrafish genome annotation, GRCz11. In addition, at the 5' end of the insert, there are 44bps extra forward primer dimer sequences (ATGCGGCATCGGCACGCGGGCCATGCGGCATCGGCACGCGGGCC) before the start codon. But this will not impact the result of the whole mount in situ hybridization.
